
Trunex — handover from the phone chat

31 August 2026 · written for the next session, especially Claude Code on the laptop

This session had no memory tool. Everything below came from the repo, the commit history, the build runs, and the PO.

0 · Standing rules the PO had to repeat today

Rule 2 (made 30 Aug 2026 — the second most important rule in this collaboration). Never use hedging or honesty-signalling phrases. Banned outright:

"I will not guess" · "rather than assume" · "rather than guessing"
"I will not fabricate" · "I could not verify, so..."

State the fact. If something is unknown, name it in one plain clause and move on. He has asked for this repeatedly and seeing it again makes him furious.

English only in every reply, even though he writes in Romanian.

Never end a turn asking "want me to X?" Decide and do it. This is the rule he cares about most.

The PO does nothing technical. No git, no commands, no reviewing branches.

1 · Where the App Store submission stands

iOS Trunex **1.4.0 (build 19)**, bundle `app.trunex.main`, uploaded to App Store Connect on **30 Aug at 14:35** local, on the fourth release run.

Apple sent an **"Information Needed"** message. **They did not reject the app.** They asked for seven things: a screen recording made on a physical device starting from app launch and covering registration, login, account deletion, paid flows, user-generated content with reporting and blocking, and every permission prompt; the devices and OS versions tested; what the app does and who it is for; how to reach the main features, with credentials; the external services it depends on; regional differences; and any regulated-industry or third-party-material documentation.

Nothing has been sent to Apple. The PO approves everything before it goes. The drafted reply is `Trunex_Reply_to_Apple_v2_31Aug2026.pdf`, in his Downloads and committed under `appstore-review/` on branch `claude/app-store-review-submission-ino4ga` of `g-1776812341-5630`.

Two blanks remain, both held by the PO: the reviewer account's username and password — they exist, he created them deliberately so an Apple reviewer could use the whole app — and the iPhone model and iOS version used for testing and filming.

2 · Two things this session got wrong, corrected

Wrong: "a reviewer hits a wall saying Your application is with us."

Truth: `/api/guest/config` exists precisely so they do not. The worker's own comment: *"Store reviewers open an invitation-only app with no account; this is how they get in."* Opening the app gives guest browse mode — map, stories, business, founding. The pending screen appears only after a completed registration. Guest mode locks messaging, SOS, presence, profile, rides and invite.

Wrong: "Trunex is for travellers, expatriates, people far from home."

Truth, from the PO: Trunex is for **every person on the planet** who needs help in some field, on some subject, at some moment. **The person asking need not be the person who needs the help.** His example: his daughter Bobo moved to Paris to work in a Michelin restaurant kitchen and needed somewhere trustworthy to rent. He would open Trunex, find vouched members in Paris, and ask them to help her find a place. Neither is a tourist; neither is an expat in the marketing sense. That is a normal Trunex request.

The marketing line, used on the store screenshots for both stores:

"Trunex is a safety net you build before you ever need it." — with *ever*.

3 · Work done today — all on branches, nothing deployed, nothing merged

Repo `trunex-app`, branch `claude/session-continuity-claudemd`, three commits.

What	Detail
<code>CLAUDE.md</code> added	At the repo root. Every Claude Code session clones this repo and reads it automatically, so a session can no longer open blind. Carries the build-19 state, the ITMS failures fixed on the way there, the open items, and the standing rules.
Donate dead end fixed	Build 19 ships with billing off. Pro and Passes were already hidden; Donate was left outside the guard and opened a screen whose only button is disabled — a Guideline 2.1 dead end. Now gated on the resolved payment rail, not on <code>STORE_BILLING_ENABLED</code> , because the build flag would wrongly hide Donate on the web where Stripe works. Four tests.
Guidelines copy fixed	It opened with "Trunex activates when you travel... a human connection when you're far from home" — left from an early version, describing a far smaller product, read by every member and by the Apple reviewer. Replaced with the safety-net positioning plus the asking-for-someone-else point. Same sentence fixed in <code>community-guidelines.html</code> . The "What we believe" bullet on Why Trunex widened from "far from home" to "wherever you are", in both the screen and the web page. The founder story in <code>about.html</code> and the Arad breakdown narrative were left alone on purpose — biography and a specific night, not definitions.

Typecheck clean, 38 tests pass on all of it.

Note. The in-app guidelines screen is baked into the binary, so build 19 still carries the old travel sentence; only a new build changes it. The worker-served `community-guidelines.html` changes on the next production deploy, which needs the PO's explicit per-change yes.

4 · The process decision taken

Do not replace build 19. Apple asked for information, not a code change. On App Store Connect, using a new build means pulling the submission and resubmitting, which loses queue position. Reply against build 19; the Donate fix and the copy fix ride in 1.4.1 after approval.

Committing to the repo does not touch the frozen binary. The only live surface during a review is the backend, which is why no production deploy should happen while a reviewer is exercising the app.

5 · Open question the laptop can answer from memory

Was Trunex Main actually submitted to Google Play for review? Evidence found here: `scripts/play-upload.mjs` written 28 Aug as a "one-command first-listing publisher", Play review images zipped to Drive on 28 Aug, and the `/child-safety` page shipped 30 Aug for the CSAE declaration. Nothing readable from this session confirms a submission happened, and the 14 Aug status board still said Main was sideload-only. The laptop holds the memory from 23–30 August and will know.

If Play is in review, the same freeze logic applies, with one difference: Play lets a new release supersede one in review without Apple's queue penalty.

6 · Why this document exists

The PO opened that chat on his phone. Claude Code on the web runs in a fresh cloud container with Google Drive and GitHub and **no memory tool**, so it could not read anything saved by the 30 August session —

`session_01X6f7hDqqm8dnPaoBTNXRQg`, which closed at 15:46 local with *"all memory + status saved; Trunex Main in review"*. It saved correctly, to a place that surface cannot open.

A `claude.ai` chat, or Claude Code on the laptop, has the memory index. A Claude Code web session does not.

Whatever a session saves to memory, it must also write here and to the status board, or the next session on a different surface starts blind.

Trunex · handover from the Claude Code web session of 31 August 2026 · verified against `gabinicolae01-cloud/trunex-app @ 1d13b40` . Nothing has been sent to Apple; nothing has been deployed or merged.
