

Trunex Main — App Store review reply

Response plan for Apple's "Information Needed" message · iOS 1.4.0 (build 19) · 31 August 2026
Prepared for PO approval. **Nothing is sent to Apple until you approve it.**

1 · What I verified before writing this

Everything below is read from the live repository `gabiniCOLae01-cloud/trunex-app` at commit `1d13b40` — not from memory. Facts I do not hold are marked **TBD** and listed for you in §6.

Fact	Verified value
Build under review	Trunex 1.4.0 (19) , bundle <code>app.trunex.main</code> , portrait-only iPhone
Paid content	None. <code>ios-release.yml</code> builds with billing off — "v1 ships FREE, no StoreKit products declared". No purchase or subscription flow exists in this build.
Code updates	Over-the-air updating is disabled for the App Store build (<code>CAP_NO_OTA=1</code> , <code>VITE_OTA_DISABLED=1</code>). The reviewed binary is what runs.
Permission prompts	Location (when-in-use only), Contacts, Camera, Photo Library, Face ID. No App Tracking Transparency, no background location — deliberately, and no such plugin may be added.
Account deletion	Real, in-app, two taps from Settings → <code>POST /api/account/delete</code> full purge. Also on the web at <code>trunex.app/delete-account</code> .
Report & block	Both shipped: <code>features/report</code> (categories + support chat) and <code>features/blocking</code> (block button, safety sheet, blocked list).
The door	Membership is invitation-only and human-approved . A normal sign-up lands on "Your application is with us". This is almost certainly why the reviewer could not exercise the app.

How build 19 got to Apple — 28 to 30 August

Reconstructed from the commits and build runs, each stamped with the session that did the work. This is the record of the submission, in place of the session notes.

Local time	What happened
28 Aug 10:25	Pre-submission blockers: <code>PrivacyInfo.xcprivacy</code> added (ITMS-91053), Anthropic disclosed as a US processor in the privacy policy, <code>admin /seasonal</code> privilege-escalation hole closed, operator corrected to SC Trunex SRL .
28 Aug 11:32	iOS marketing version aligned to 1.4.0 (build 18) — it had lagged at 1.2.79.
30 Aug 12:18	<code>/child-safety</code> standards page shipped for Play's CSAE declaration.
30 Aug 13:16	Full IAP audit: the paywall was exported but mounted on no route , so nothing was buyable — a certain 2.1 rejection. Routed, 3.1.2 disclosures added, runner pinned to macos-26.
30 Aug 13:25	Push entitlement (<code>aps-environment</code>) added — ITMS-90078.
30 Aug 14:00	PO decision: v1 ships free. Billing reverted to off; Pro and Passes rows hidden when billing is off.

30 Aug 14:11	Signing fixed: archive unsigned, distribution signing applied at export.
30 Aug 14:18	alttool 90474 — the bundle declared iPad but ships portrait-only. Switched to iPhone-only .
30 Aug 14:30	ITMS-90683 — the Contacts plugin references the Contacts API, so <code>NSContactsUsageDescription</code> became mandatory. Added, build 18 → 19 .
30 Aug 14:35	Build 19 uploaded to App Store Connect. Fourth run, successful.

2 · The video — what Apple is actually asking for

This is the part you said was unclear, so plainly:

It is not a marketing video. It is not the App Preview that appears on the store page. It is private evidence, seen only by the reviewer. Its single purpose is to prove that a human being held a real iPhone and that the app does what the listing says it does.

Why they asked us for one. Reviewers ask for a recording when they could not drive the app themselves. Trunex is invitation-only with human approval — they signed up, hit the "waiting for a human" screen, and never saw the product. The video is how they see it. The demo account (\$4) is how they get in themselves. We give them both.

Their words, decoded

Apple wrote	What that means for us
"captured on a physical device"	A real iPhone in your hand. Not the Simulator, not the Android phone, not the website, not a slideshow of screenshots.
"running the latest operating system"	Update the iPhone to the current public iOS before filming.
"must begin with launching the app"	The first frame is the iPhone home screen and a finger tapping the Trunex icon. Never start with the app already open.
"typical user flow through its core features"	Use the app the way a member would, unhurried, in one take.
"registration, login, account deletion"	We have all three → all three must be on camera.
"paid content ... purchase or subscription"	Not applicable. v1 is free. We say so in writing instead of filming it.
"user-generated content, reporting and blocking"	We have all of it → must be on camera.
"prompts requesting sensitive data"	The iOS permission dialogs themselves must appear on camera — location, camera, contacts, Face ID.

Format. Portrait. One continuous take if you can manage it. 4–7 minutes. No music, no captions, no speed-up, no cuts that skip a screen. Narration is optional — what counts is what is on the screen. Recorded with the iPhone's own screen recorder: Settings → Control Centre → add *Screen Recording*, then swipe down and tap the record button.

3 · The shooting script

Before you press record

- iPhone updated to the latest public iOS.
- Install the exact build under review from TestFlight — **1.4.0 (19)**.
- **Delete the app first, then reinstall.** iOS shows each permission dialog once per install. If you have already granted them, they will not appear and the video fails Apple's fourth bullet.
- Sign out everywhere. Have the demo credentials on paper, not on the phone.
- Do Not Disturb on. Battery above 50%. Nothing personal in notifications.

#	What you do	What must be visible — and why Apple wants it
1	Home screen, tap the Trunex icon.	The launch itself. Their explicit requirement: "must begin with launching the app".
2	Let the splash finish; the map loads.	The location permission dialog . Tap <i>Allow While Using App</i> . Then let members appear as pins. Covers 5.1.1 purpose strings and the "sensitive data prompts" bullet.
3	Show the door: tap through to <i>Join as a reader</i> , fill the first field, then go back without finishing.	Proves registration exists and works. Do not complete it — a real sign-up needs human approval, which is exactly the wall they hit.
4	Sign in with the demo account.	The login flow, end to end, landing on the map as a full member.
5	Map: <i>By skills, By zone, By route</i> . Open one member's profile.	The core product. Show the "Vouched by" chain — that is the thing that makes Trunex Trunex.
6	Stories → open one → <i>Share a story</i> → attach a photo.	User-generated content, plus the camera and photo-library dialogs . Post something harmless.
7	On another member's profile: the safety sheet → Block . Then Report → pick a category → submit.	Guideline 1.2. This is not optional — an app with UGC and no visible report/block path is rejected on sight. Finish with Settings → <i>Blocked members</i> showing the result.
8	Chats: open a conversation, send a message. Business tab: open a listing.	The remaining core surfaces, so the flow reads as complete.
9	You → <i>Invite someone</i> → pick from contacts.	The contacts permission dialog . Back out afterwards; do not send an invitation.
10	Open the SOS sheet. Read the disclaimer on screen. Cancel .	Shows the safety feature and its "not an emergency service — call 112" wording. Do not send . A live SOS alerts the ten nearest real members.
11	Sign out. Sign back in with Face ID.	The Face ID dialog . Last of the four permission prompts.
12	You → Settings → <i>Delete account</i> → read the screen → type DELETE → confirm.	Guideline 5.1.1(v). Film this on the throwaway account, not the demo account — the purge is real and irreversible.
13	Swipe home.	A clean end.

Sending it. Reply in App Store Connect → App Review, attach the file there. Large files sometimes fail to attach, so we also paste an unlisted YouTube link in the reply text as a fallback. I will confirm the current attachment size cap against Apple's own documentation before we send; developer.apple.com is blocked from this session's network.

4 · Draft reply — items 2 to 7, paste-ready

This is the text that goes into *App Store Connect* → *App Review Information* → *Notes*, and into the reply. Read it as the finished article; the highlighted fields are the ones only you can fill.

DEMO ACCOUNT

Trunex is an invitation-only network. A normal sign-up creates an account that a human moderator must approve by hand, which is why review was unable to reach the app's features. Please use the pre-approved demo account below. It is a full member, has no two-factor step, and does not expire.

Username: **TBD** · Password: **TBD**

Second account, provided so you can exercise account deletion without losing the first: **TBD** / **TBD**

2 · DEVICES AND OPERATING SYSTEMS TESTED

TBD — see §6

3 · WHAT THE APP DOES, WHO IT IS FOR

Trunex is a private, invitation-only network of adults who vouch for one another, so that a member can find trustworthy help from a real person anywhere they happen to be.

The problem it solves. When something goes wrong away from home — a breakdown on a foreign motorway, an unfamiliar city, a job that needs doing by someone who will not take advantage — open directories and public marketplaces cannot tell you who is actually trustworthy. Anyone can list themselves, and no one is accountable for the listing.

How Trunex answers it. Every member is personally invited and vouched for by an existing member, and that chain of vouching is visible on each profile, so trust is traceable to a named person rather than to a star rating. Members publish the skills they have and the geographic zones they know well. Another member can then search by skill, by area, or along a planned route, message the person directly, and see exactly who vouched for them. If something goes seriously wrong, an SOS alerts the ten nearest members and opens a group conversation with them.

The value. A member travelling, working or living away from home is never dependent on strangers with no accountability: they reach someone a member they trust has already vouched for.

Audience. Adults, 18 and over. Drivers and long-distance travellers, tradespeople, small business owners, and people living or working abroad. The app is not directed at children and contains no content aimed at them.

4 · SETTING UP AND REACHING THE MAIN FEATURES

1. Launch the app and allow location when asked. The map opens with members shown near you. Positions are deliberately offset by 200–300 m; Trunex never displays a member's exact location.
2. Tap "Sign in" and use the demo credentials above.
3. **Finding people** — on the map, use "By skills", "By zone" or "By route". Tap any pin to open a member profile and see the vouching chain.
4. **User-generated content** — the Stories tab. Tap "Share a story" to post text and a photo.
5. **Reporting and blocking** — open any member profile, tap the safety action at the top right: Block is immediate, Report opens a category picker. Blocked members are listed under You → Settings → Blocked members.
6. **Messaging** — the Chats tab, one-to-one and group.
7. **Businesses** — the Business tab lists services run by members and recommended by other members.
8. **SOS** — the orange button on the map. Please do not complete an SOS: it alerts ten real members and opens a live conversation with them. The confirmation screen shows the full flow without sending.
9. **Account deletion** — You → Settings → Delete account. It is immediate and irreversible; please use the second demo account for it.

No sample files are required.

5 · EXTERNAL SERVICES USED

- **Cloudflare Workers and Workers KV** — application backend, hosting and data storage.
- **Mapbox GL** — maps and geocoding.
- **Apple Push Notification service**, addressed through Firebase Cloud Messaging — push notifications.
- **Resend** — transactional email (sign-up, invitations, notifications).
- **Twilio** — SMS one-time codes during sign-up.
- **Cloudflare Turnstile** — anti-abuse verification on sign-up.
- **Anthropic Claude** — used server-side only, for automated screening of member-submitted text against our community guidelines, and for drafting community email copy. It is not exposed as a chat or content-generation feature to members, and member data is not used to train any model.
- **Stripe** — used only by the trunex.app website. The iOS app contains no purchase flow of any kind, opens no payment page, and never reaches Stripe.

Paid content. Version 1.4.0 ships entirely free. There are no in-app purchases, no subscriptions and no paid features, and no StoreKit products are declared for this build. There is therefore no purchase flow to demonstrate.

6 · REGIONAL DIFFERENCES

The app behaves identically in every region. There is no region-locked content, no regional pricing, no geographically restricted feature, and no regional variation in what a member can see or do. The interface is in English everywhere. The member network is worldwide, so the people shown on the map differ by location — that is the product working as intended, not a regional feature difference.

7 · REGULATED INDUSTRIES AND THIRD-PARTY MATERIAL

Trunex does not operate in a regulated industry. It provides no medical, legal or financial advice, processes no payments in this version, and is not an emergency service. The SOS feature states plainly, in the app and before every send, that it is not an emergency service, is not monitored around the clock, and that the user should call their local emergency number first.

All content, branding and source code are owned by SC Trunex SRL. Map data is licensed from Mapbox under their commercial terms. The app contains no third-party protected material.

NOTES FOR THE REVIEWER

- Please do not send a live SOS — it alerts ten real members and opens a conversation with them.
- Account deletion is real and immediate; the second demo account is provided for it.
- The app requests location only while it is in the foreground. It has no background location capability and no tracking; it does not present the App Tracking Transparency prompt because it tracks nothing.

5 · Risks that could earn us a second rejection

These are things I found in the code that a reviewer may run into. Each needs a decision from you.

R1 — The demo account must be pre-approved on production. If we hand them an account that lands on "Your application is with us", we get rejected again on the same ground. The account has to be a full approved member, on production `trunex.app` (not staging), with two-factor off, and it must not be suspended or expire during review.

R2 — The Donate dead end: fixed. Commit `8808c39` (30 Aug) hid Trunex Pro and Passes when billing is off, but Donate was left outside that guard and still opened a screen whose only call to action is disabled. It is now gated on the resolved payment rail rather than on the build flag, so it disappears on a device that cannot take money and stays on the web, where Stripe can. Four tests cover it; typecheck and the full suite pass. On branch `claude/session-continuity-claudemd` in `trunex-app`, awaiting your call on whether 1.4.0 (19) is replaced by a 1.4.1 or the reply goes as-is.

R3 — Turnstile on sign-up. The reviewer may try to register before reading the notes. If the anti-abuse check misfires on their network, they will read it as a broken sign-up. Worth a line in the notes telling them to use the demo account rather than registering.

R4 — A reviewer may send a live SOS. It alerts the ten nearest real members. The written warning above helps, but it is a request, not a guard. Tell me if you want a code-level guard for flagged demo accounts; that is a change to the next build, not something to fix in the reply.

6 · What I need from you

Everything else is done. These three are facts only you hold.

#	Question	Why it has to come from you
1	Which iPhone model(s) and iOS version did you test 1.4.0 on before submitting?	Apple's item 2 asks for it literally. The list has to come from the devices in your hand.
2	Does a pre-approved demo account already exist on production? If not, shall I create two — one member, one throwaway for the deletion shot?	I can create them through the backend on your word.
3	Do you have an iPhone on hand to film on, and is it on the latest iOS?	The recording has to come from a physical iOS device. Without one we need a different plan, and that changes the whole reply.
